The novel《Georges》, published under Alexander Dumas' name, may actually have been written by Felicien Mallefille. A comparison of《Georges》with well-known Dumas' novels such as《The Count of Monte Cristo》suggests that Dumas had little to do with《Georges》. For example, the characters of《Georges》are tiresomely earnest, while those from Dumas' well-known novels crack jokes and utter colorful oaths. Meanwhile, in a technical sense,《Georges》is well-written, while《The Count of Monte Cristo》, with all its verve and sparkle, is full of redundancies, repetitions, and non sequiturs. As Umberto Eco discovered while attempting to translate《The Count of Monte Cristo》, the charm of Dumas' novel and its "narrative wisdom" are inseparable from its "linguistically sludgy and gasping" prose.

One characteristic of terrestrial cratering is the presence of doublet craters: 3 of the 28 large impact craters on Earth (greater than 20 kilometers diameter) have partner craters. For example, the Kamensk crater in Russia, 25 kilometers in diameter, is partnered by the Gusev crater, 3 kilometers wide and of identical age. Since such doublets form when two well-separated asteroids impact Earth nearly simultaneously, their relatively frequent occurrence serves as evidence for the existence of a substantial population of co-orbiting asteroids.

Are other rocky planets subject to impacts from co-orbiting asteroids? Venus is a promising planet to search for doublets because its surface is young, erosion is nearly nonexistent, and its crater population is significantly larger than Earth's, but not so large that there is a high probability of chance associations. Researchers found that the proportion of doublet craters on Venus is significantly smaller than on Earth. However, Venus' denser atmosphere may screen out the smaller member of some asteroid pairs. If Earth had a similar screening effect, only one of its three known doublets would have formed, making the proportion of doublet craters on Earth (3.6%) identical to Venus' (2.2%) within uncertainties. The researchers concluded that co-orbiting asteroids must be common among both the near-Earth and near-Venus asteroid populations.

Wildcats are improbable candidates for domestication. Like all felids (cats), wildcats are obligate carnivores, meaning they have a limited metabolic ability to digest anything except proteins. Wildcats live a solitary existence and defend exclusive territories, making them more attached to places than to people. Furthermore, cats do not perform directed tasks and their actual utility is debatable; even as mousers, in this latter role, terrier dogs and ferrets are preferable. Accordingly, there is little reason to believe an early agricultural community would have sought out and selected the wildcat as a house pet. Rather, the best inference is that wildcats exploiting human environments were simply tolerated by people and, over time and space, they gradually diverged from their "wild" relatives.

Paintings of property—anything that was possessed—such as those created by eighteenth-century British painter George Stubbs were condemned by several of Stubbs's contemporaries: objects thus "individualized" would appeal to our appetite to own and enjoy them, whereas "generalized" objects in other paintings were no longer merely things but abstract ideas. To collect or commission paintings displaying lofty unconcern with materiality was considered by these commentators a mark of taste and civic virtue, the ability to subordinate private material interests to the abstract, public interest. Yet this notion of disinterested taste and virtue was founded on private interest: it was because the "public" man or woman already owned enough that he or she was presumed to be free from the urge to own more. Political power and status were thus based on the ownership of property, while at the same time they were legitimated by the claim that the avaricious behavior associated with the acquisition of property was somehow transcended by those who had already acquired it.

Sport fishers introduced the zander, a type of perch, to Britain's rivers and canals in the 1970s. Because zander eat large numbers of smaller fish, they have had a devastating effect on native fish populations. To protect the native fish, a government program removed a significant proportion of the zander from Britain's waterways last year. Surprisingly, this year the loss of native fish to zander has been greater than before.

The phonograph never merely recorded music: it changed both how people listened and how they played. Early recordings of violinists suggest that vibrato—the trembling action of hand or fingerboard that gives notes a warbling sweetness—was once used more sparingly than it is today. By the 1930s, many leading violinists had adopted continuous vibrato, which became the approved style taught in conservatories. Musicologist Mark Katz proposes that technology prompted the change. When vibrato's wobble was added to violin tone, the phonograph could pick it up more easily; acoustically, it's a "wider" sound. Also, vibrato's fuzzier focus enabled players to cover up inaccuracies of intonation, and phonographs made players self-conscious about intonation. What worked in recording studios spread to concert stages.
