Female Australian Dunatothrips (small, sap-sucking insects) create tent-like structures on the surface of leaves to protect themselves and their eggs and larvae from desiccation in the arid Australian climate. Bono and Crespi compared survival and reproduction of thrips that founded structures alone with those in groups of two or more individuals. They found that although per capita egg production fell with increasing group size, foundresses were more likely to survive and lay eggs in groups than when alone. Several studies of other species of nest-building insects have concluded that foundress associations are beneficial to all parties. It is likely that the relative success of groups is at least in part accounted for by a reduction of energy use in the modification of a shared nest.

Biologists know that some marine algae can create clouds by producing the gas dimethylsulphide (DMS), which reacts with oxygen in air above the sea to form solid particles. These particles provide a surface on which water vapor can condense to form clouds. Lovelock contends that this process is part of global climatic-control system. According to Lovelock, Earth acts like a super organism, with all its biological and physical systems cooperating to keep it healthy. He hypothesized that warmer conditions increase algal activity and DMS output, seeding more clouds, which cool the planet by blocking out the Sun. Then, as the climate cools, algal activity and DMS level decrease and the cycle continues. In response to biologists who question how organisms presumably working for their own selfish ends could have evolved to behave in a way that benefits not only the planet but the organisms as well, Lovelock points out that cooling benefits the algae, which remain at the ocean surface, because it allows the cooled upper layers of the ocean to sink, and then the circulating water carries nutrients upward from the depths below. Algae may also benefit from nitrogen raining down from clouds they have helped to form.

Typical of Argentine melodrama of the 1930s were the films starring Libertad Lamarque, the genre's biggest box-office attraction. Her most frequent role was that of the tango singer whose romance with a wealthy suitor is blocked by his elitist family. Despite its widespread social acceptance by the 1930s, tango continued to be associated in film melodramas with criminality and vice. As Diana Paladino remarks, in these films, "the tango songstress was doomed from the start." Nevertheless, if melodramatic logic dictated that Lamarque be punished for the transgressive act of singing tango, surely that judgment was not shared by the members of the audience, many of whom were drawn to her early movies precisely because of her fame as a tango singer.

The trader's dilemma, which typically occurs in peasant villages, arises in two contexts. First, the trader buys agricultural products in his or her village; although these products are often resold outside the village at a market, where laws of supply and demand exist and profit margins are rather limited, the trader nevertheless feels morally obliged to pay fellow villagers a good price for their products or even eventually to share profits with those villagers. Second, in his or her village shop, the trader sells imported products, but because of villagers' constrained finances must do so at reduced price, or even on credit. In both cases, the trader confronts the risk of either losing working capital or losing the respect and moral support of neighbors and kinfolk.

A classical way out of the dilemma, according to Evers, is sociocultural differentiation of peasants and traders into two separate, locally coexisting moral communities. Evers' point is theoretically significant because it implies that such differentiation may be economically rather than politically motivated. Thus, while in many societies traders are strangers, a migrant minority, it may also happen that a resident trading minority itself creates cultural distance in order to find a solution for the trader's dilemma, which thus may drive sociocultural change.

According to the passage, the "sociocultural change" alluded to in the passage would occur as a result of

○**A** outside influences being brought to the village by villagers who travel as traders

○**B** a rejection of individual economic interests in favor of communal political interests as a motive for action

○**C** the recognition by peasant farmers that their interests were aligned with those of traders

○**D** some villagers adopting cultural practices that imitate those of migrant traders

○**E** a social segmentation within a village that reflects differentiated economic roles

It can be inferred that the "way out of the dilemma" described by Evers works by allowing

○**A** prices to be set by a market in which there are many buyers and many sellers

○**B** people from outside the village to play the role of economic intermediary between the village and the outside world

○**C** traders to fill dissociated roles as buyers and sellers on one hand and as neighbors and members of the village's moral community on the other

○**D** villagers a greater range of options when they are selling their produce or buying supplies

○**E** a weakening of the social and cultural bonds between traders and the people from whom they buy and to whom they sell

Whether the film is _____ adaptation of the legend is debatable; the author of the screenplay claims that it was based on the original tale, but admits taking some interpretive license with the story.

- ☐ **A** an inspired
- ☐ **B** a rigorous
- ☐ **C** an unsentimental
- ☐ **D** a successful
- ☐ **E** a sober
- ☐ **F** a faithful

rigorous(엄격한, 정확한)와 faithful(충실한)이 짝.

craven(비겁한)과 cowardly(겁 많은)가 짝.

Iridium, a hard, whitish metal similar to platinum, is extremely rare on Earth. Extremely high concentrations of iridium on Earth result from only two scenarios: massive volcanic eruptions that release iridium from deep within the Earth and meteorites that shower down on Earth from space. When scientists found concentrations of iridium 30 times higher than normal in rock stratum from 65 million years ago, they concluded that a massive meteor or comet hit the Earth and caused the massive extinction of the dinosaurs.

○**C** Most scientists support the hypothesis that a cosmic impact wiped out the dinosaurs.

○**D** The massive extinction that occurred 70 million years ago killed not only the dinosaurs but also 70 percent of all life on Earth.

○**E** A comet struck the earth some 120 million years ago, but no widespread extinction occurred.

Saturn's E ring consists of particles so small that they would be dispersed by solar radiation pressure in a few tens of thousands of years. That the ring exists today suggests, therefore, that it originated in the relatively recent past—but how? Researchers suggest that Enceladus, one of Saturn's moons, may be responsible. This icy moon has no craters, possibly because liquid water from its interior flowed across the surface in the relatively recent past, erasing all preexisting impact features. An impact into Enceladus within the past thousand years or so may have blasted liquid water into space. Water droplets would have frozen quickly into ice crystals, which may then have drifted through the Saturnian system and formed into the E ring.

- ☐ **B** Enceladus's lack of craters is not due to erasure by water.
- ☐ **C** No impact has occurred on Enceladus in the past few tens of thousands of years.
